ABSTRACT: Fungal flora of teak (*Tectona grandis* L.f.) seeds were recorded from inflorescence stage up to the full mature seeds. Many non systemic and systemic fungi were found associated with the whole process. Systemic fungi like *Fusarium oxysporum*, *F. moniliforme*, *F. solani* and *F. pallidoroseum* play an important role in poor seed setting, seed abortiveness and seed germination.

Key words: *Tectona grandis*, *Fusarium oxysporum*, *F. moniliforme*, *F. solani*, *F. pallidoroseum*, abortiveness.
